Synthis Process Modeler

Key Benefits

- Solution-specific forms, templates, and reports created by industry experts facilitate knowledge capture
- Customizable SmartShapes ensure consistent detail and quality throughout your process models
- Unlimited drill downs and daisy-chaining provide seamless top-down and bottom-up process navigation
- Pre-built and user-definable libraries of customer, industry and regulatory requirements help mitigate compliance risks
- Process models containing shared objects can auto update and provide valuable insight and transparency
- Embedded links to relevant documents, forms, web pages and third-party systems bring your process maps to life

In order to comply with internal policies and external requirements, organizations must have a thorough understanding of established procedures and workflows.

The Synthis Process Modeler™ enables you to create information-rich process maps that quickly evolve to become valuable, multi-dimensional models of your organization's processes.

Process Modeling Made Easy

From the shop floor to the executive suite, the Process Modeler makes it easy for business and operations people to map and document their business processes. With the Process Modeler, creating high-value process models that support strategic and tactical decision-making is now within the reach of any organization.

Solution-specific forms, templates and reports facilitate the capture and maintenance of business process knowledge in a way that lets corporate users, regardless of technology aptitude, create information-rich process models with the same or less effort used to create static flowcharts and process narratives.

To facilitate requirements documentation and tracking, definitions of published standards and regulations can be imported into projects and incorporated into process models using simple drag-and-drop techniques.

Pre-built reports can be used to trace through your process model and identify

the processes, documents, systems and people that will be impacted whenever any business practice, industry standard or government regulation changes.

Pre-defined document templates can be published to the Synthis Process Repository™ and automatically populated with process model data to give authorized repository users on-demand access to the latest approved content in their preferred format.

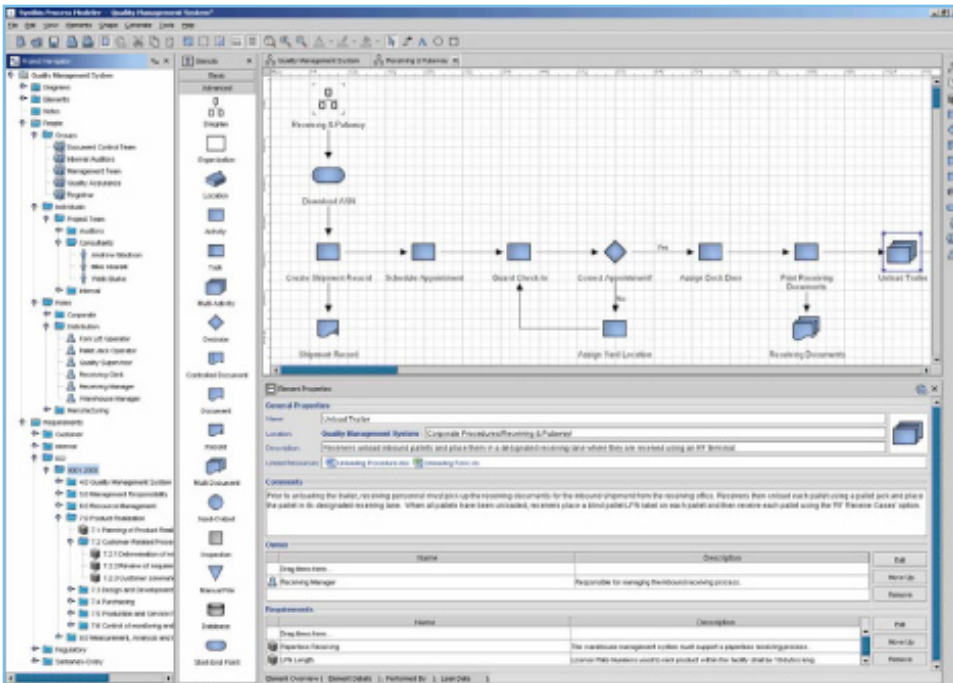

Organizations can finally move away from the "fire drill" approach that has traditionally been used to manage most compliance and continuous improvement programs by enabling key individuals to capture their business process knowledge in a more intelligent, reusable format and making it easy for others to put that knowledge to work.

Business Process Insight Anytime, Anywhere

Synthis Process Modeler's advanced Web publishing capabilities enable unprecedented transparency and information access throughout the

The Synthis Process Modeler™ is part of the Lean Compliance Suite™, which also includes the Synthis Process Repository™ and Synthis Portal Server™.

Synthesis Process Modeler™ makes it easy for organizations to create, maintain and share high-quality process documentation in multiple formats. Using simple drag-and-drop techniques, users can create information-rich process maps that can be easily shared via the Web or corporate Intranet.

extended enterprise. Published documents and reports can be easily accessed via the Web or corporate Intranet, anytime and anywhere.

Today, Synthesis customers leverage the information captured in their process models to:

- Conduct more effective process audits.
- Train new employees on established policies and procedures.
- Streamline ongoing compliance and continuous improvement programs.
- Identify and communicate best practices to employees and business partners.
- Improve communication and information sharing throughout the organization.

With a simple click, businesses automatically create and publish a complete Web site of their processes in a unique, diagram-based format, which makes process visualization, navigation and access to information point-and-click simple.
